CALGARY***

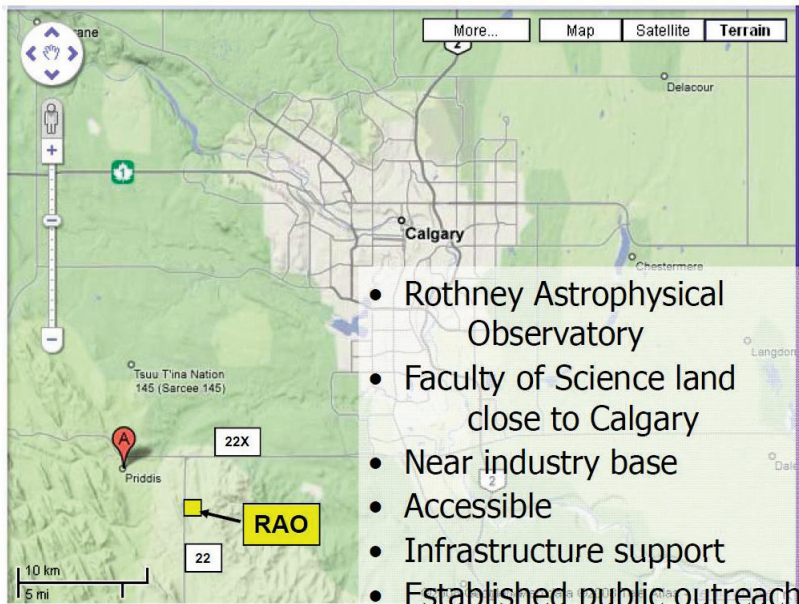

***CREWES***

# OUTLINE

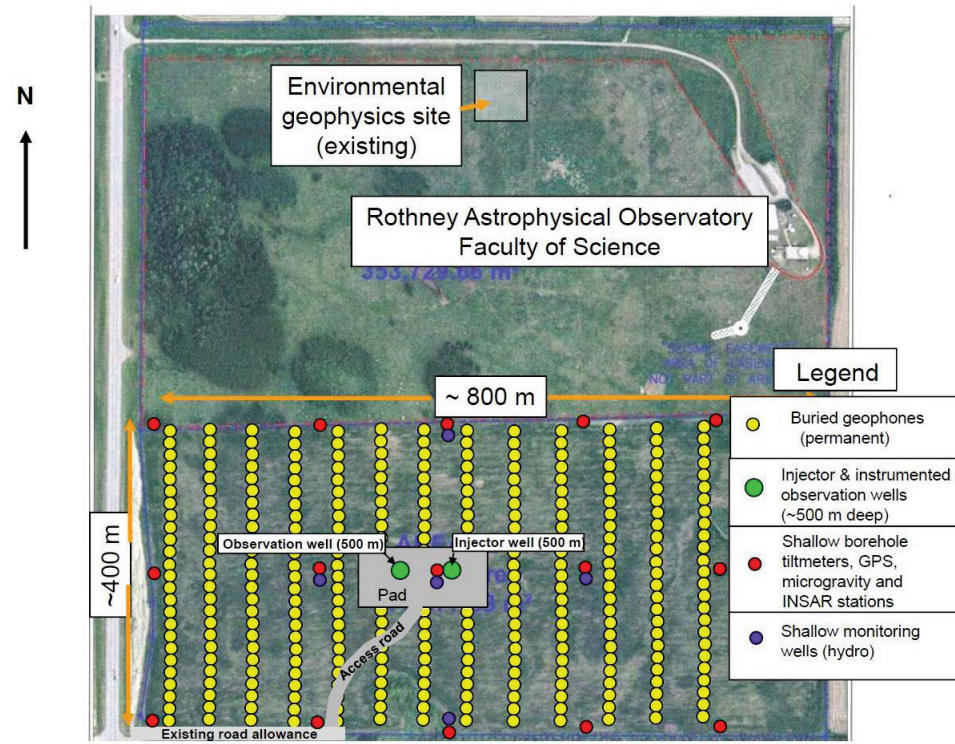

- *Introduction / Motivation*
- *Automatic Time Picking*
- *Hypocenter Location using noisy data*
  - *Hodogram/back-azimuth analysis*
  - *Nonlinear Optimization*
    - *Levenberg-Marquardt inversion*
    - *Direct search (GA and PS)*
- *Summary and Conclusions.*

# Microseismic Monitoring

# ***FAST AUTOMATIC TIME PICKING***

***Develop the MER (modified energy ratio) technique for automatic time picking and compare with the standard STA/LTA method.***

# STA/LTA Ratio

$$STA = \sum_{j=i}^{i-l_1} grm(i)^2 / l_1$$

Short-term average

$$l_2 = 10 * l_1$$

$$LTA = \sum_{j=i}^{i-l_2} grm(i)^2 / l_2$$

Long-term average

# Modified Energy Ratio

$$er(i) = \frac{\sum_{j=i}^{i+L} grm(j)^2}{\sum_{j=i-L}^i grm(j)^2}$$

$$mer(i) = [er(i) * abs(grm(i))]^3$$

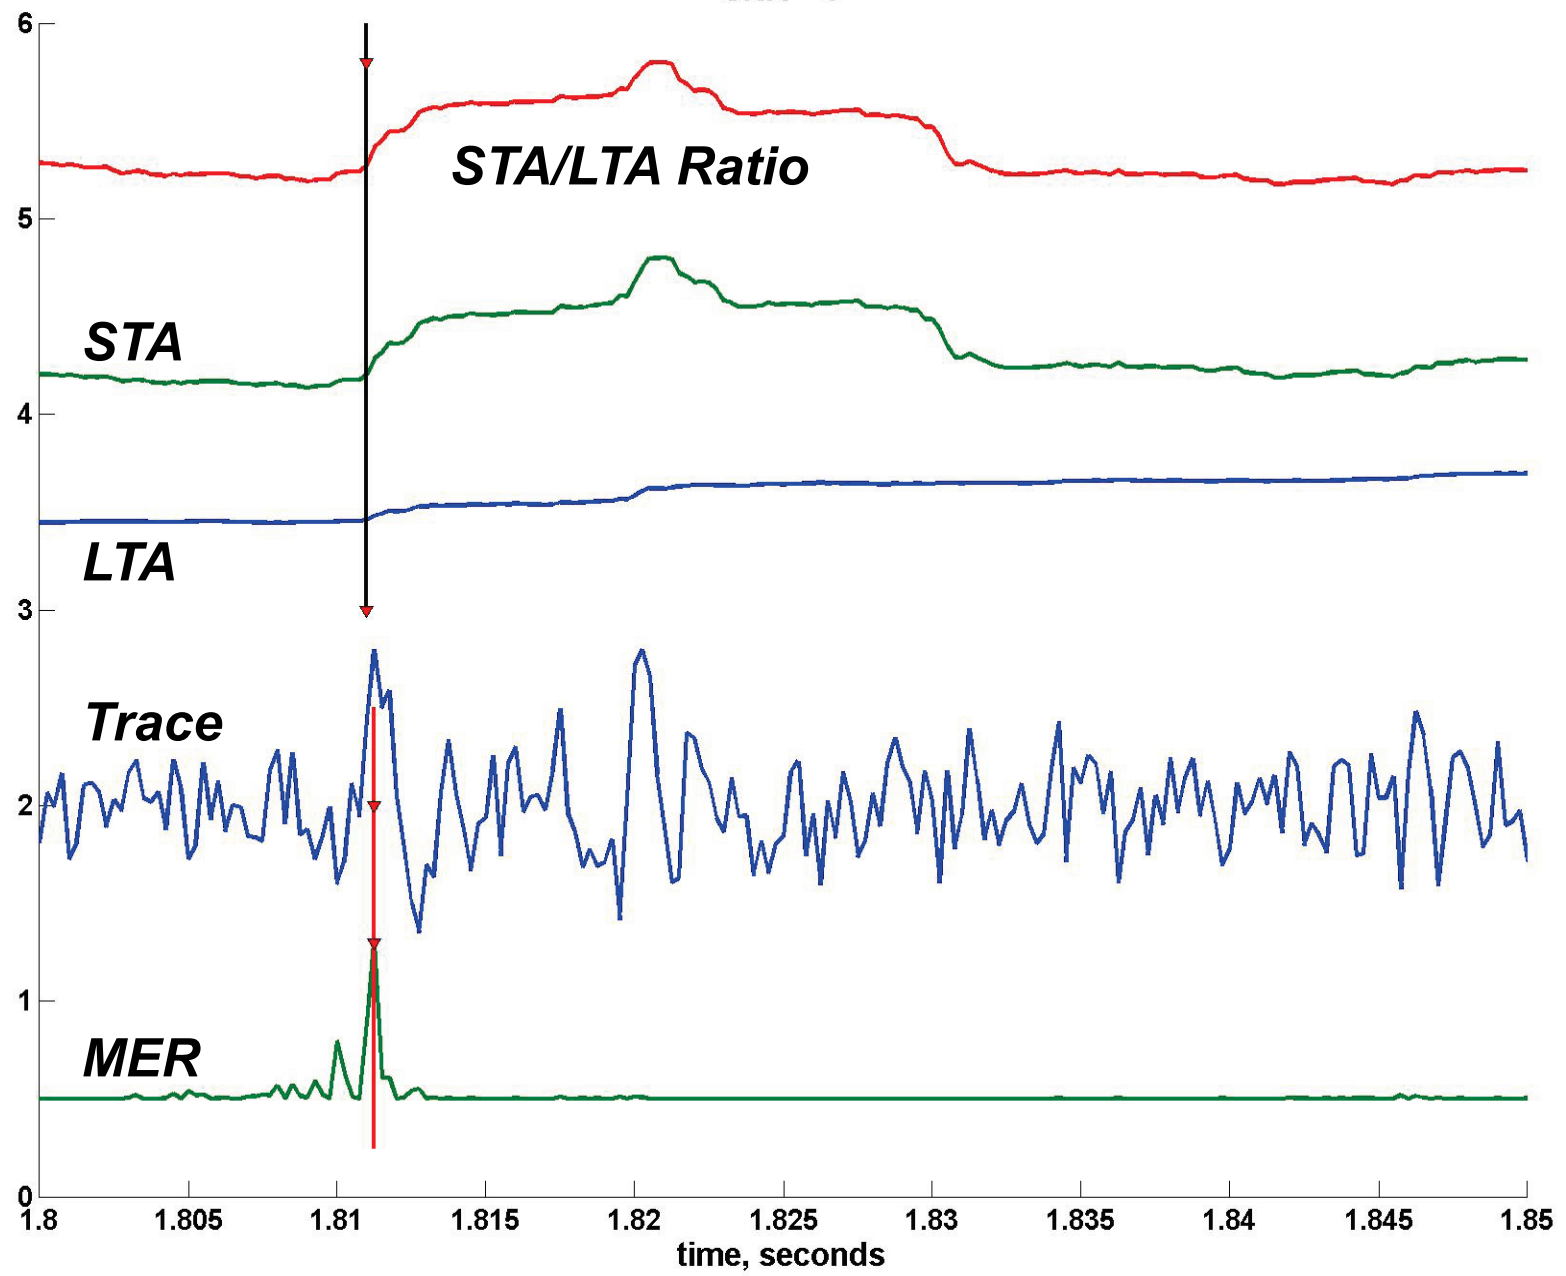

## Energy Windows

Trailing 

SNR = 3

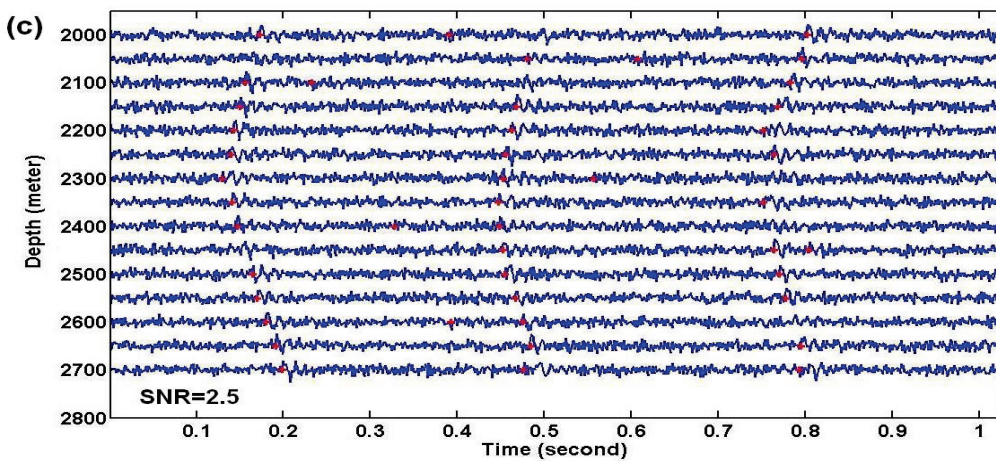

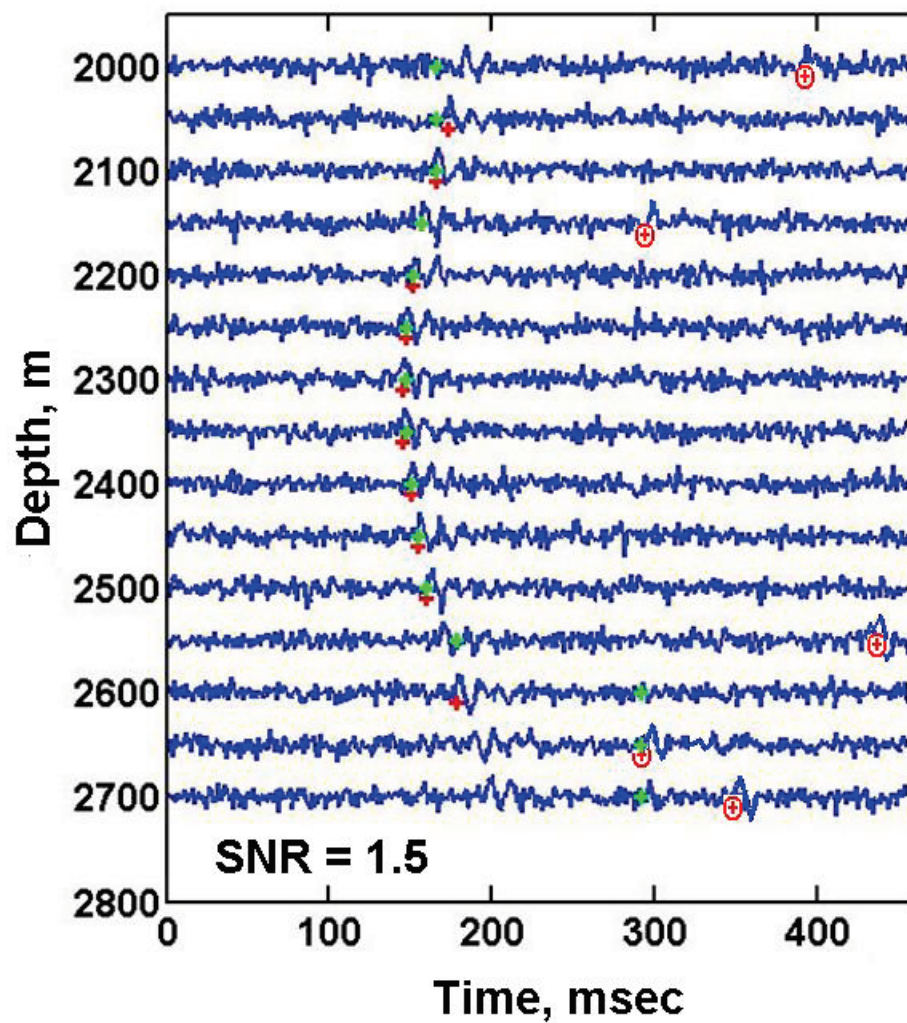

MER Time Picks, SNR = 3

### STA/LTA Time Picks, SNR = 3

# ***HODOGRAM / BACK-AZIMUTH METHOD FOR LOCATING HYPOCENTERS USING NOISY 3C MICROSEISMOGRAMS***

***Develop techniques for mitigating the effects of random noise on location accuracy.***

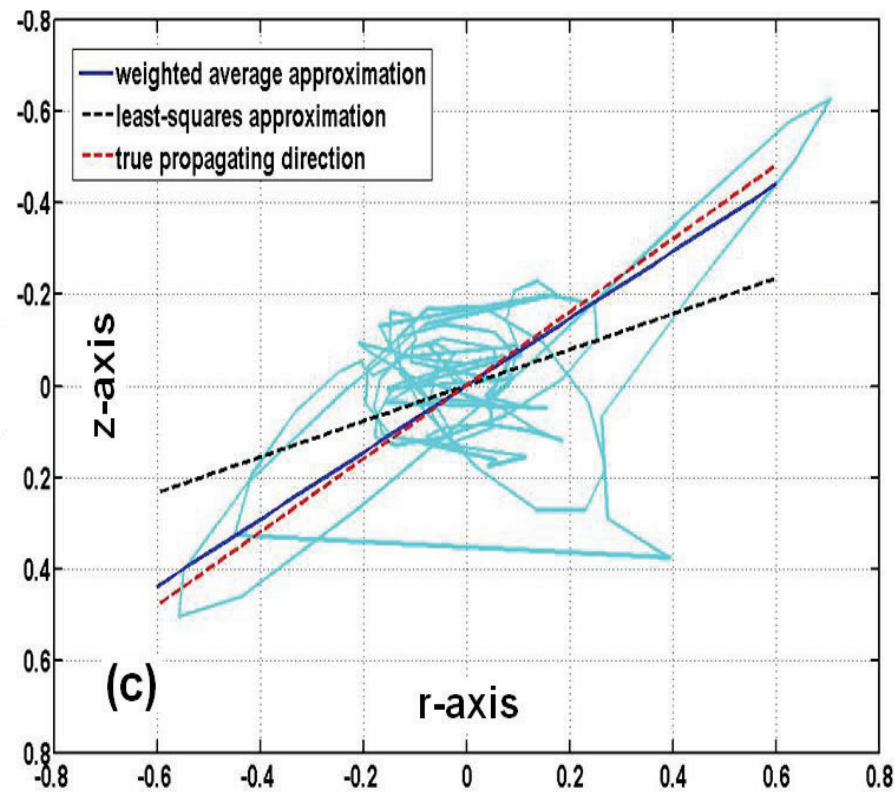

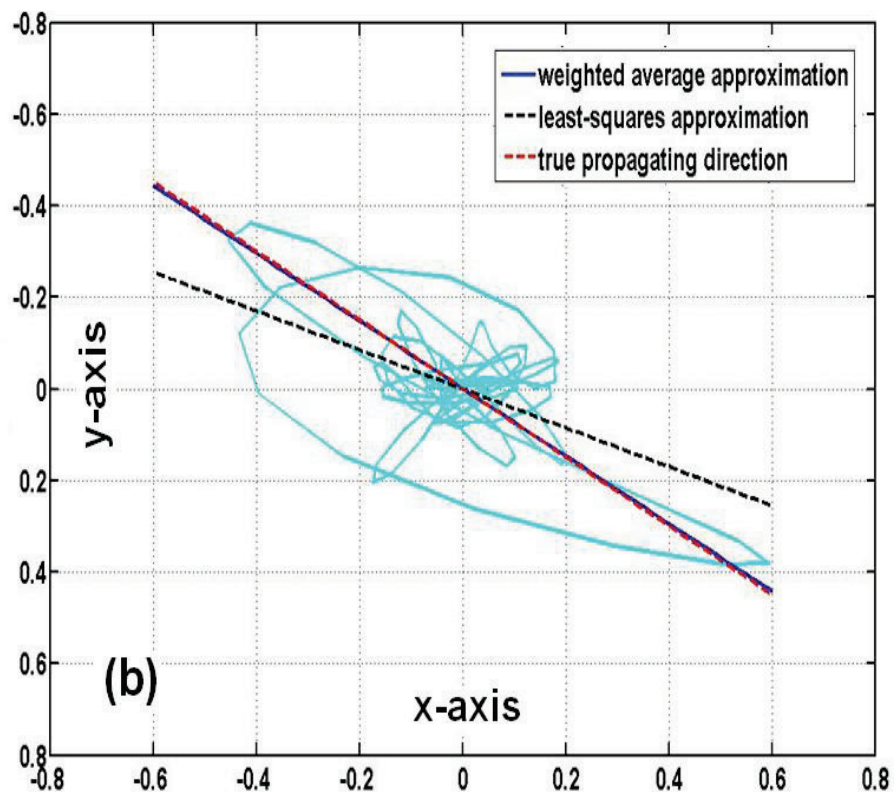

***Test on synthetic seismograms generated for a layered-earth velocity model.***

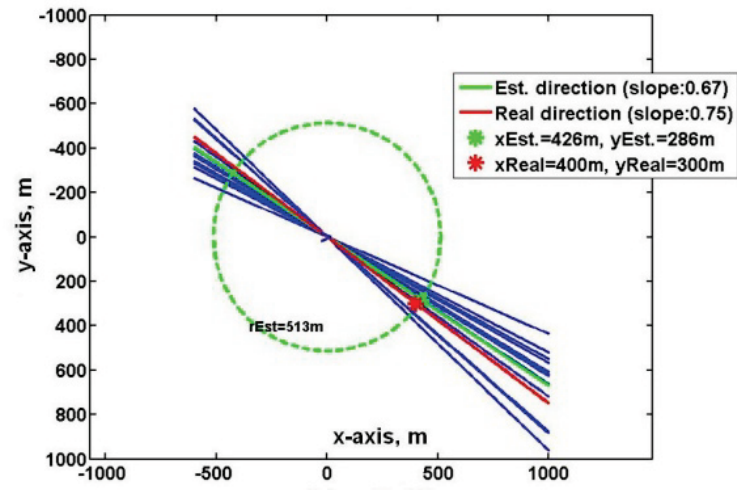

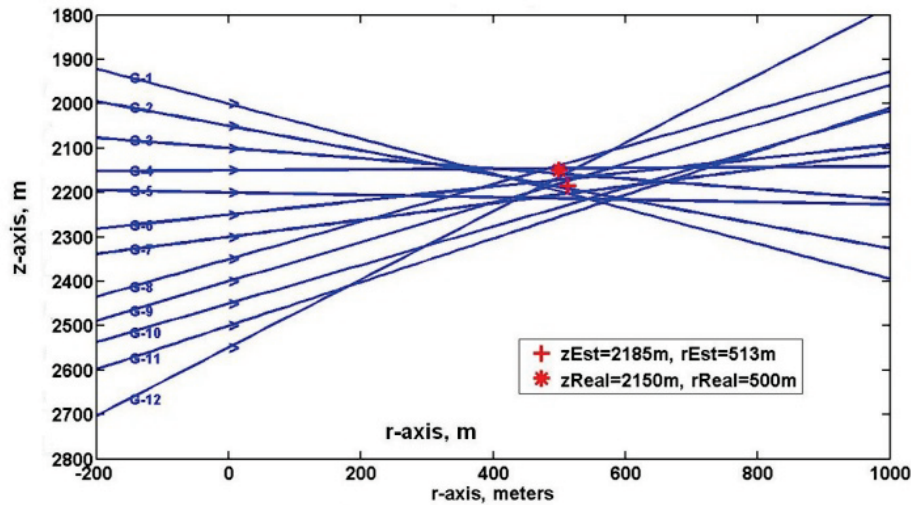

Microseism and borehole-observation geometry (3D view)

Section of verti. B.H. and source(s)  
( Azimuth of section: 37 degree; Polar angle of array: 0 degree )

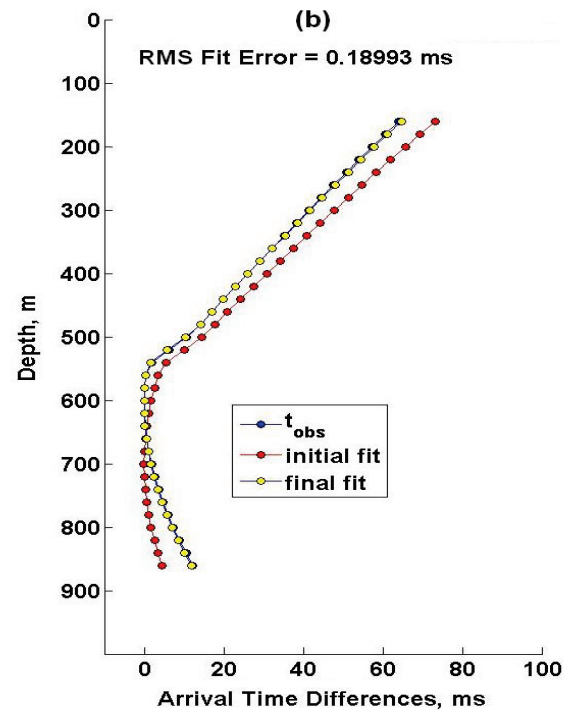

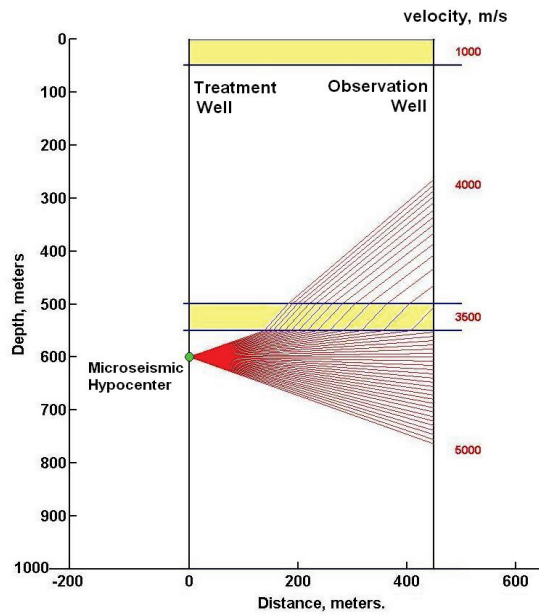

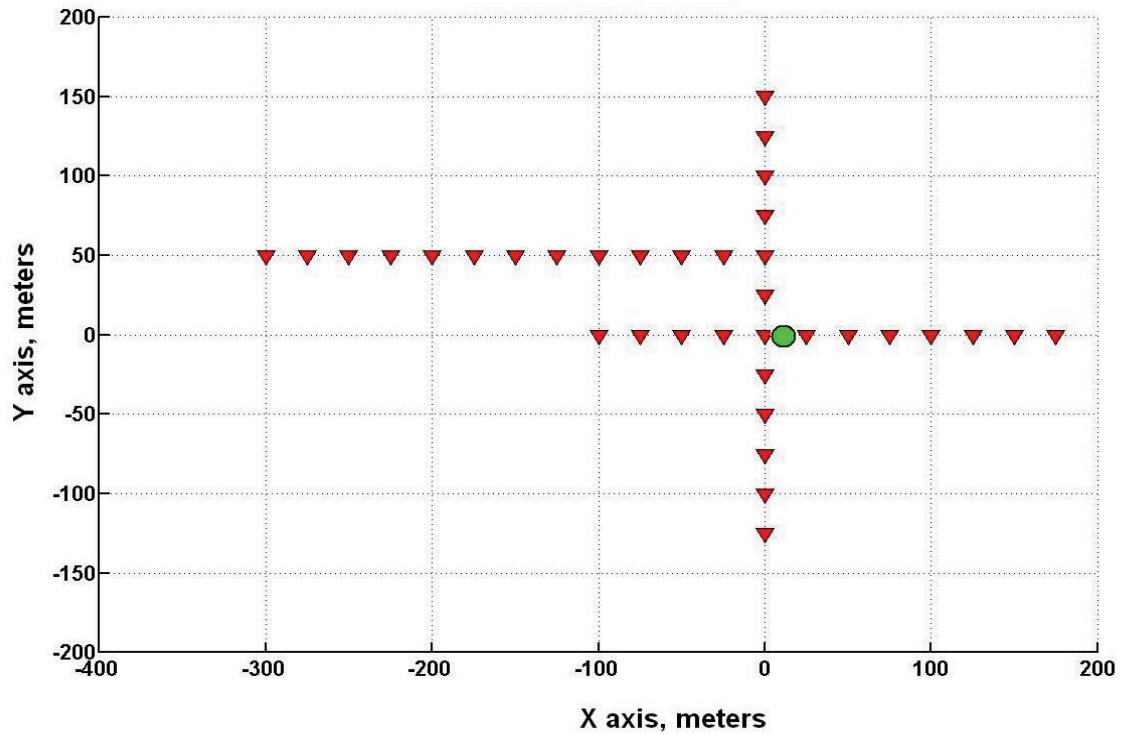

# ***NONLINEAR OPTIMIZATION FOR HYPOCENTER LOCATION***

- ***Invert observed arrival times for hypocenter coordinates  $(x_s, y_s, z_s)$ .***
- ***Gradient based method (Levenberg-Marquardt).***
- ***Direct search methods (Genetic Algorithm and Pattern Search).***

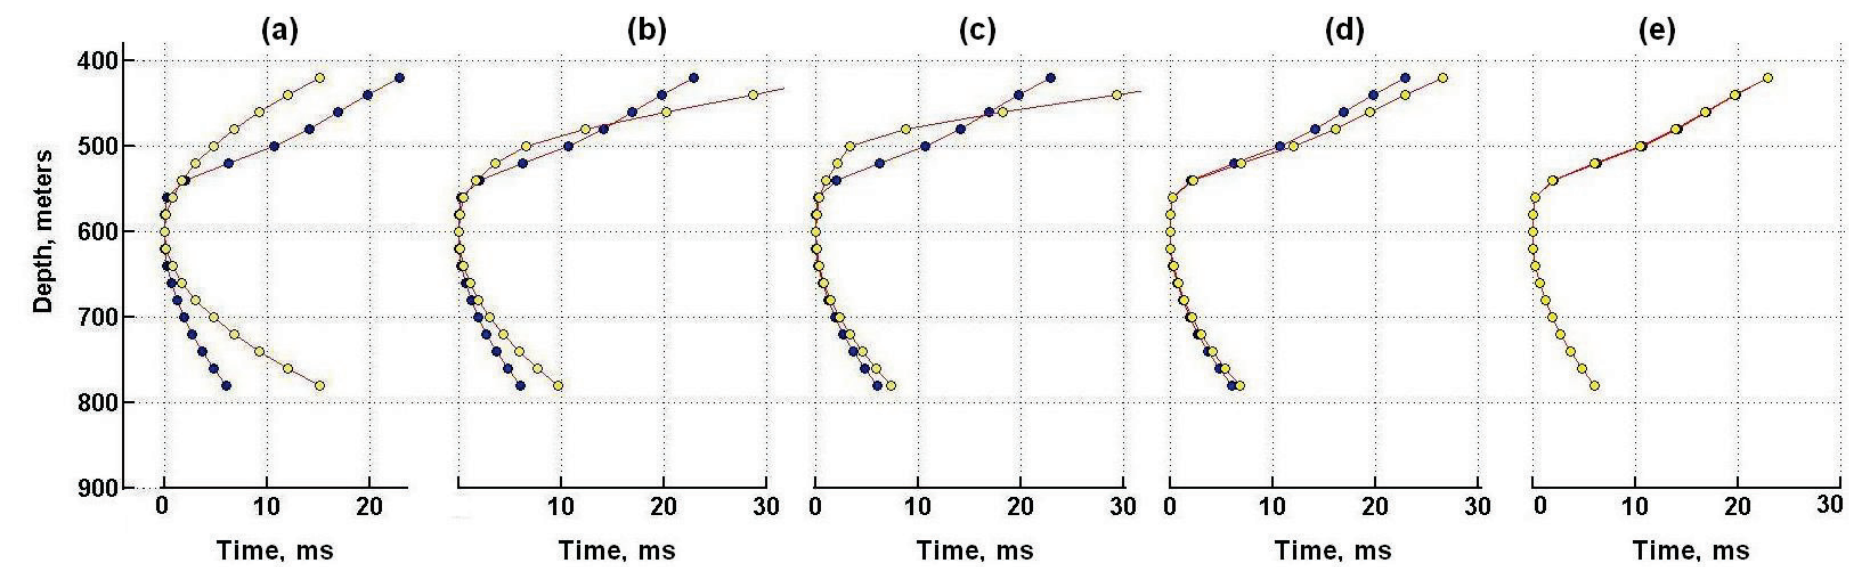

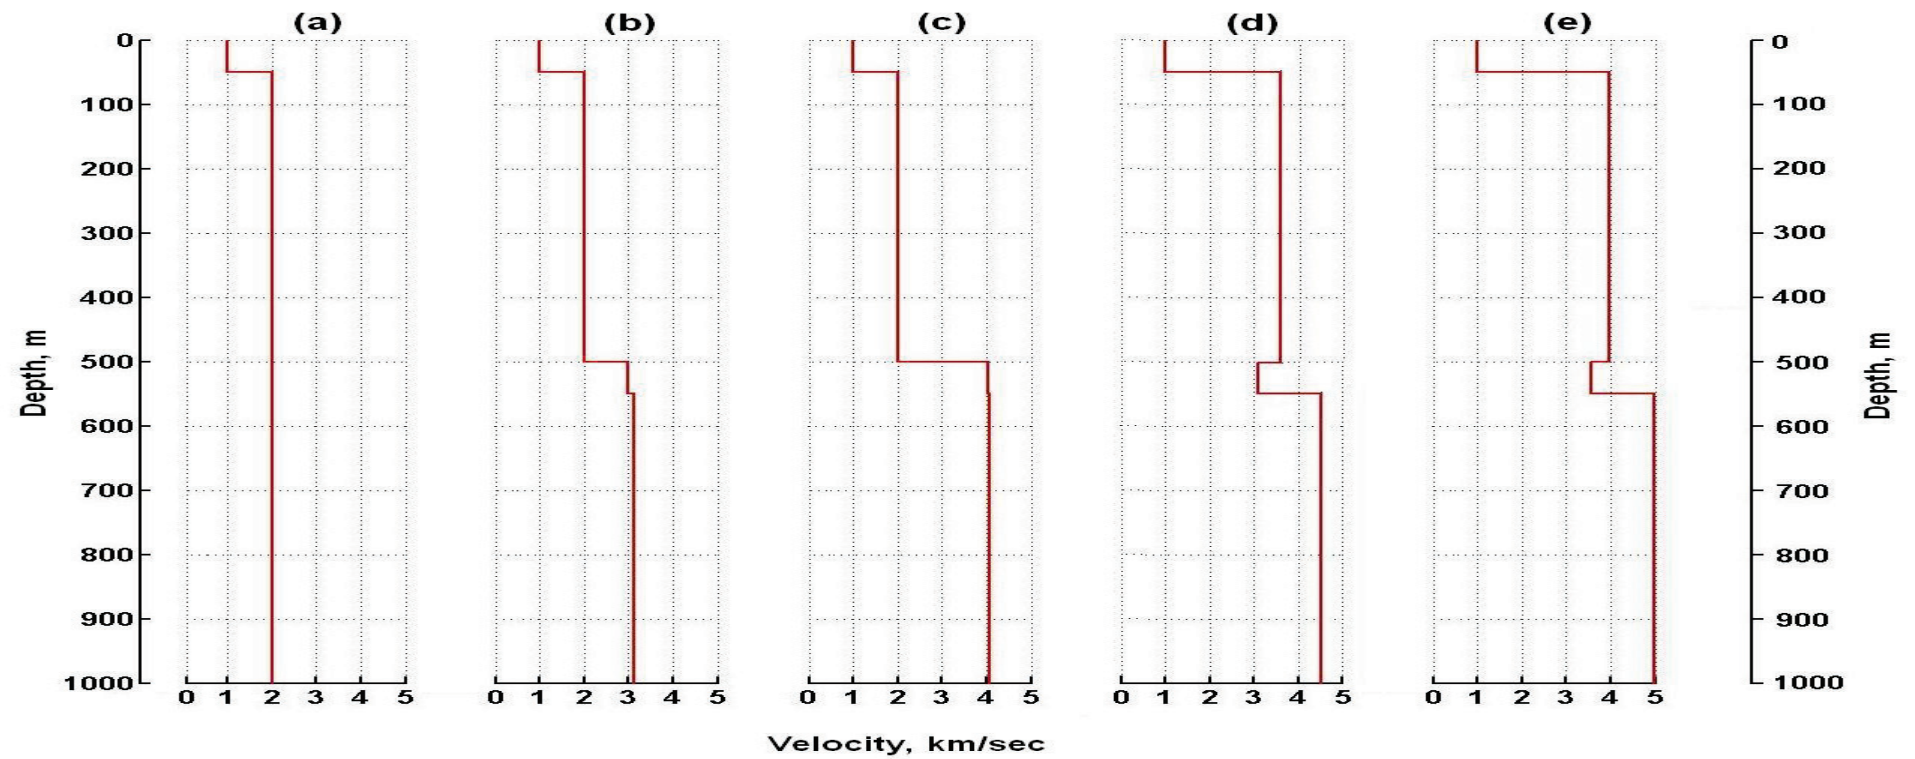

Final Fit Error = 2.0054 milliseconds

Final Fit Error = 0.072995 milliseconds

# ***OTHER METHODS FOR LOCATING HYPOCENTERS***

- ***Apollonius spheres (Bancroft, 2007).***
- ***Analytic method (Bancroft, 2009).***
- ***Migration techniques (future work).***

# **SUMMARY AND CONCLUSIONS**

- *For automatic time picking on noisy seismograms, our MER method is faster and more consistent than the STA/LTA method.*
- *With noisy 3C microseismograms, reasonably accurate hypocenter locations can be found using hodogram / back-azimuth analysis when we mitigate the effects of random noise.*
- *After comparing both gradient-based and direct search methods for inverting microseismic arrival time data, it appears that Pattern Search is the fastest and most efficient.*

# ***ACKNOWLEDGEMENTS***

***We thank the industrial sponsors of CREWES and NSERC for supporting this work. Field data was provided by Talisman Energy Inc.***
